PART-2

CHAPTER 6

HALOALKANES & HALOARENES

QUESTION AND ANSWERS

2MARKS

- 1. Name the following halides according to the IUPAC system and classify them as alkyl, allyl, benzyl (primary, secondary, tertiary), vinyl, or aryl halides:
- (i)(CH₃)2CHCH(CI)CH₃
- (ii) CH₃CH₂CH(CH₃)CH(C₂H₅)CI
- (iii) CH₃CH₂C(CH₃)₂CH₂I
- (iv)(CH₃)3CCH₂CH(Br)C6H₅
- (v)CH₃CH(CH₃)CH(Br)CH₃
- (vi)CH₃C(C2H₅)₂CH2Br
- (vii)CH₃C(CI)(C₂H₅)CH₂CH₃
- (viii)CH₃CH=C(CI)CH₂CH(CH₃)₂
- $(ix)CH_3CH=CHC(Br)(CH_3)_2$
- $(x)P-CIC_6H_4CH_2CH(CH_3)_2$
- (xi)m-CICH₂C₆H₄CH₂C(CH₃)₃
- (xii)o-Br -C₆H₄CH (CH₃)CH₂CH₃
- Ans: (i) 2-Chloro-3methylbutane, 2° alkyl halide
- (ii) 3-Chloro-4methyl hexane, 2° alkyl halide
- (iii) 1 -lodo-2,2-dimethylbutane, 1 ° alkyl halide
- (iv) I-Bromo-3, 3-dimethyl -1-phenylbutane, 2° benzylic halide
- (v) 2-Bromo-3-methylbutane, 2° alkyl halide
- (vi) 1-Bromo-2-ethyl-2-methylbutane, 1° alkyl halide
- (vii)3-Chloro-3-methylpentane, 3° alkyl halide
- (viii) 3-Chloro-5-methylhex-2-ene, vinylic halide
- (ix)4-Bromo-4-methylpent-2-ene, allylic halide
- (x)1-Chloro-4-(2-methylpropyl) benzene, aryl halide

- (xi)1-Chloromethyl-3- (2,2-dimethylpropyl) benzene, 1 ° benzylic halide.
- (xii)1-Bromo-2-(I-methylpropyl) benzene, aryl halide.
- 2. Give the IUPAC names of the following compounds:
- (i) CH₃CH(CI)CH (Br)CH₃ (ii) CHF₂CBrCIF (iii) CICH₂C=CCH₂Br (iv) (CCI₃)₃CCI
- $(v)CH_3C(p-CIC_6H_4)_2CH(Br)CH_3(vi)(CH_3)_3CCH=C(CI)C_6H_4I-p$
- Ans: (i) 2-Bromo-3-chlorobutane
- (ii) 1 JBromo-1 -chloro-1,2,2-trifluoroethane
- (iii) I-Bromo-4-chlorobut-2-yne
- (iv)2-(Trichloromethyl)-I, 1,1,2,3,3,3- heptachloropropane
- (v)2-Bromo-3,3-bis-(4-chlorophenyl) butane
- (vi)I-Chloro-I-(4-iodophenyl)-3,3- dimethylbut-I-ene.
- 3. Write the structures of the following organic halogen compounds:
- (i)2-Chloro-3-methylpentane
- (ii)p-Bromochlorobenzene
- (iii)I-Chloro-4-ethylcyclohexane
- (iv)2r (2-Chlorophenyl) -1- iodooctane
- (v)2-Bromobutane
- (vi)4-tert-Butyl-3-iodoheptane
- (vii)1-Bromo-4-sec-butyl-2-methylbenzene
- (viii)1,4-Dibromobut-2-ene

Ans:

$$(vii)$$
 CH₃ - CH₂ - CH - CH₃
 CH_3
 CH_3
 CH_3

(viii)
$$BrCH_2 - CH = CH - CH_2Br$$

4. Write the equations for the preparation of 1-iodoobutanefrom (i)1-butanol (ii)1-chlorobutane (iii) but-l-ene.

Ans:

(i)
$$CH_3CH_2CH_2CH_2OH + KI + H_3PO_4$$

 $\rightarrow CH_3CH_2CH_2CH_2I + H_2O + KH_2PO_4$

(iii)
$$CH_3 CH_2 - CH = CH_2 + HBr \xrightarrow{Percoick}$$

5. What are ambident nucleophiles? Explain with an example.

Ans: Nucleophiles which can attack through two different sites are called ambident nucleophiles. For example, cyanide ion is a resonance hybrid of the following two structures:

$$TC \equiv N: \longleftrightarrow :C = \ddot{N}$$

It can attack through carbon to form cyanide and through N to form is O cyanide.

6. Which compound in each of the following-pairs . will react faster in SN2 reaction with -OH? (i)CH₃Br or CH₃I (ii)(CH₃)₃CCI or CH₃CI

Ans: (i)Since I⁻ ion is a better leaving group than Br- ion, therefore, CH_3I reacts faster CH_3Br in S_N2 reaction with OH^- ion. (ii)On steric grounds, 1° alkyl halides are more reactive than tertalkyl halides in S_N2 reactions. Therefore, CH_3CI will react at a faster rate than $(CH_3)_3CCI$ in a S_N2 reaction with OH^- ion.

5MARKS

1. Which one of the following has the highest dipole moment?

(i)CH₃Cl₂ (ii) CHCl₃ (iii) CCl₄

Ans: The three dimensional structures of the three compounds along with the direction of dipole moment in each of their bonds are given below:

CCl₄ being symmetrical has zero dipole moment. In CHCl₃, the

resultant of two C - Cl dipole moments is opposed by the resultant of C - H and C - Cl bonds. Since the dipole moment of latter resultant is expected to be smaller than the former, CHCl₃ has a finite dipole (1.03 D) moment. In CH₂Cl₂, the resultant of two C - Cl dipole moments is reinforced by resultant of two C - H dipoles, therefore, CH₂Cl₂ (1.62 D) has a dipole moment higher than that of CHCl₃. Thus, CH₂Cl₂ has highest dipole moment.

2. A hydrocarbon C₅H₁₀ does not react with chlorine in dark but gives a single monochloro compound C₅H₉Cl in bright sunlight. Identify the hydrocarbon.

Ans: The hydrocarbon with molecular formula C₅H, 0 can either a cycloalkane or an alkene.

Since the compound does not react with Cl_2 in the dark, therefore it cannot be an alkene but must be a cycloalkane. Since the cycloalkane reacts with Cl_2 in the presence of bright sunlight to give a single monochloro compound, C_5H_9Cl , therefore, all the ten hydrogen atoms of the cycloalkanes must be equivalent. Thus, the cycloalkane is cyclopentane.

No reaction
$$\leftarrow \frac{\text{Cl}_2}{\text{dark}}$$

Cyclopentane
$$(C_5H_{10})$$

Cl

Sunlight

Monochloro-cyclopentane
$$(C_5H_9\text{Cl})$$

3. Write the isomers of the compound having formula C_4H_9Br .

Ans:

Double bond equivalent (DBE) for C4H9Br

$$=\frac{4(4-2)+9(1-2)+1(1-2)}{2}+1=0$$

So none of the isomer has a ring or unsaturation, so the isomers are position or chain isomers

- 4. Predict all the alkenes that would be formed by dehydrohalogenation of the following halides with sodium ethoxide in ethanol and identify the major alkene:
- (I) 1-Bromo-I-methylcyclohexane
- (ii) 2-Chloro-2-methylbutane.
- (iii) 2,2,3-Trimethyl-3-bromopentane.

Ans:

$$(i) \xrightarrow{H^{\beta}} \xrightarrow{Br} \xrightarrow{C_{2}H_{5}ONa/C_{2}H_{5}OH} \xrightarrow{CH_{3}} \xrightarrow{CH_{3}} \xrightarrow{CH_{2}} \xrightarrow{CH_{3}} \xrightarrow{CH_$$

5. Write the mechanism of the following reaction:

$$n$$
-BuBr + KCN $\xrightarrow{\text{EtOH-H}_2\text{O}}$ n -BuCN

Ans: KCN is a resonance hybrid of the following two contributing structures:

$$K^{+}[-:C = N: \leftarrow \rightarrow :C = N:^{-}]$$

Thus, CN⁻ ion is an ambident nucleophile. Therefore, it can attack the "carbon atom of C-Br bond in n-BuBr either through C or N. Since C – C bond is stronger than C – N bond, therefore, attack occurs through C to form n-butyl cyanide.

$$K^{+}CN^{-} + CH_{3}CH_{2}CH$$

CLASS 12

6. Out of C₆H₅CH₂Cl and C₆H₅CHClC₆H₅which is more easily hydrolysed by aqueous KOH.

Ans: C₆H₅CH₂Cl is 10 aryl halide while C₆H₅CH(Cl)C₆H₅ is a 2° aryl halide. In S_N1 reactions, the reactivity depends upon the stability of carbocations.

$$\begin{array}{c} C_6H_5 - CH - C_6H_5 & \xrightarrow{Ionization} & C_6H_5 - CH - C_6H_5 + Cl^{-1} \\ Cl & \xrightarrow{Carbocation is stabilized by delocalization over two} \\ C_6H_5 & \xrightarrow{Carbocation is stabilized by delocalization over one} \\ C_6H_5CH_2Cl & \xrightarrow{Ionization} & C_6H_5CH_2 + Cl^{-1} \\ & \xrightarrow{Carbocation is stabilized by delocalization over one} \\ & C_6H_5 & \text{ring} \end{array}$$

Since the $C_6H_5CHC_6H_5$ carbocation is more stable than $C_6H_5CH_2$ carbocation, therefore, $C_6H_5CHCIC_6H_5$ gets hydrolysed more easily than $C_6H_5CH_2CI$ under S_N1 conditions. However, under S_N2 conditions, the reactivity depends on steric hindrance, therefore, under S_N2 conditions, $C_6H_5CH_2CI$ gets hydrolysed more easily than $C_6H_5CHCIC_6H_5$.

7MARKS

- 1. How will you bring about the following conversions?
- (I) Ethanol to but-I-yne.
- (ii) Ethane to bromoethene
- (iii) Propene to 1-nitropropane
- (iv) Toluene to benzyl alcohol
- (v) Propene to propyne
- (vi) Ethanol to ethyl fluoride
- (vii) Bromomethane to propanone
- (viii) But-I-ene to but-2-ene
- (ix) 1-Chlorobutane to n-octane
- (x) Benzene to biphenyl

Ans:

(i)
$$CH_3CH_2OH \xrightarrow{SOCl_2, Pyridine} CH_3CH_2 - Cl$$
Ethanol
$$CH \equiv CH + NaNH_2 \xrightarrow{Liq NH_3, 196K} HC \equiv C^- Na^+$$
Sodium acetylide (II)
$$CH_3 - CH_2 - CI + HC \equiv C^- Na^+ \longrightarrow CH_3CH_2 - C \equiv CH + NaCI$$
(I)

(ii)
$$CH_3 - CH_3 + Br_2 \xrightarrow{hv, 520-670 \text{ K}} CH_3CH_2 - Br + HBr$$

Ethane
$$\frac{KOH(alc)}{-HBr} \rightarrow CH_2 = CH_2 \xrightarrow{Br_2/CCl_4} BrCH_2CH_2Br \xrightarrow{\Delta/KOH(alc)} CH_2 = CHBr$$

Bromoethene

(iii) $CH_3 - CH_3 + Br_2 \xrightarrow{hv, 520-670 \text{ K}} CH_2 - Br_2/CCl_4 \rightarrow BrCH_2CH_2Br \xrightarrow{\Delta/KOH(alc)} CH_2 = CHBr$

Bromoethene

$$(iii) \ \, \text{CH}_{3} - \text{CH} = \text{CH}_{2} - \underbrace{\overset{\text{HBr,ROOR}}{\text{Peroxide effect}}} \\ \xrightarrow{\text{Propene}} \text{CH}_{3}\text{CH}_{2}\text{CH}_{2}\text{CH}_{2}\text{Br} \\ \xrightarrow{\text{1-Bromopropane}} \xrightarrow{\text{AgNO}_{2},\text{C}_{2}\text{H}_{5}\text{OH}/\text{H}_{2}\text{O}} \\ \xrightarrow{\text{1-nitropropane}} \text{CH}_{3}\text{CH}_{2}\text{CH}_{2}\text{NO}_{2}$$

(iv)
$$CH_3$$
 CH_2CI CH_2CI CH_2OH

Toluene CH_2CI CH_2OH

Aq. KOH; Δ

Benzyl chloride CH_2OH

Benzyl alcohol

(v)
$$CH_3 - CH = CH_2 \xrightarrow{Br_2/CCl_4} CH_3 - CH - CH_2 \xrightarrow{KOH (alc.), \Delta \atop -2KBr, -2H_2O} CH_3 - C \equiv CH$$

Propene

Br Br

1,2-Dibromo propane

$$(vi) \ \, \operatorname{CH}_3\operatorname{CH}_2\operatorname{OH} \xrightarrow{-\operatorname{SOC}_1} \cdot \operatorname{Pyridine} \xrightarrow{-\operatorname{SO}_2} \cdot \operatorname{HCl} \xrightarrow{-\operatorname{FQ}_2\operatorname{Cl}_2} \operatorname{CH}_3\operatorname{CH}_2\operatorname{F}_{\operatorname{Ethyl}}\operatorname{fluoride}$$

$$(vii) \ \, \operatorname{CH}_3 \longrightarrow \operatorname{Br} \xrightarrow{\operatorname{KCN}(\operatorname{alc})} \operatorname{CH}_3\operatorname{CN} \xrightarrow{\operatorname{CH}_3\operatorname{MgBr}/\operatorname{ether}} \xrightarrow{\operatorname{CH}_3} \operatorname{CH}_3 \longrightarrow \operatorname{CH}_3 \xrightarrow{\operatorname{CH}_3\operatorname{MgBr}/\operatorname{ether}} \xrightarrow{\operatorname{CH}_3} \operatorname{CH}_3 \longrightarrow \operatorname{CH}_3 \xrightarrow{\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}_3} \xrightarrow{\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}_3} \xrightarrow{\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}_3} \xrightarrow{\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}_3} \xrightarrow{\operatorname{Propanone}} \operatorname{CH}_3 \xrightarrow{\operatorname{HBr}} \xrightarrow{\operatorname{Br}} \xrightarrow{\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}} \xrightarrow{\operatorname{CH}_3} \xrightarrow{\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}} \xrightarrow{\operatorname{CH}_3} \xrightarrow{\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}} \xrightarrow{\operatorname{CH}_3} \xrightarrow{\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}} \xrightarrow{\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}_3} \xrightarrow{\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}_3\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}_3} \xrightarrow{\operatorname{CH}_3\operatorname{CH}_2\operatorname{CH}_3$$

2. Explain why

- (i) the dipole moment of chlorobenzene is lower than that of cyclohexyl chloride?
- (ii) alkyl halides, though polar, are immiscible with water?
- (iii) Grignard reagents should be prepared under anhydrous conditions?

Ans: (i) sp²-hybrid carbon in chlorobenzene is more electronegative than a sp³-hybrid carbon in cyclohexylchloride, due to greater s-character. Thus, C atom of chlorobenzene has

CLASS 12

less tendency to release electrons to CI than carbon atom of cyclohexylchloride.

As a result, C – Cl bond in chlorobenzene is less polar than in cyclohexylchloride. Further, due to delocalization of lone pairs of electrons of the Cl atom over the benzene ring, C-Cl bond in chlorobenzene acquires some double bond character while the C – Cl in cyclohexyl chloride is a pure single bond. In other words, C-Cl bond in chlorobenzene is shorter than in cyclohexyl chloride. Since dipole moment is a product of charge and distance, therefore, chlorobenzene has lower dipole moment than cyclohexylchloride due to lower magnitude of negative charge on the Cl atom and shorter C-Cl distance.

- (ii) Alkyl halides are polar molecules, therefore, their molecules are held together by dipole-dipole attraction. The molecules of H₂O are hold together by H-bonds. Since the new forces of attraction between water and alkyl halide molecules are weaker than the forces of attraction already existing between alkyl halide alkyl halide molecules and water-water molecules, thefefore, alkyl halides are immiscible (not soluble) in water. Alkyl halide are neither able to form H- bonds with water nor are able to break the H-bounding network of water.
- (iii) Grignard reagents are very reactive. They react with moisture present in the apparatus to form alkanes

$$R - Mg - X + H - OH \longrightarrow$$

$$R - H + Mg(OH)X$$

Thus, Grignard reagents must be prepared under anhydrous conditions.

3. Give the uses of freon 12, DDT, carbon tetrachloride, and iodoform.

Ans: lodoform: It was earlier used as an antiseptic but the antiseptic properties are due to the liberation of free iodine and not due to iodoform itself. Due to its objectionable smell, it has been replaced by other formulations containing iodine.

Carbon tetrachloride:

Uses:

- (i)As an industrial solvent for oil, fats, resins etc.and also in dry cleaning.
- (ii)CCl₄ vapours are highly non-inflammable, thus CCl₄ is used as a fire extinguisher under the name pyrene.
- (iii)Used in the manufacture of refrigerants and propellants for aerosol cans.

Freons: Freon-12 (CCl₂F₂) is most common freons in industrial use.

Uses: For aerosol propellants, refrigeration, and air conditioning purposes.

DDT (p -p' - Dichloro diphenyl - trichloro ethane):

- (i)The use of DDT increased enormously on a worldwide basis after World War II, primarily because of its effectiveness against the mosquitoes that spreads malaria and other insects which damages crops.
- (ii) However, problems related to extensive use of DDT began to appear in the late 1940 s. Many species of insects developed resistance to DDT, it was also discovered to have a high toxicity towards fishes. DDT is not metabolised very rapidly by animals, instead, it is deposited and stored in the fatty tissues. If the ingestion continues at a steady rate, DDT builds up within the animal's overtime.

4. Write the structure of the major organic product in each of the following reactions:

(v)
$$C_6H_5ONa + C_7H_5CI \longrightarrow$$

$$(vi)$$
, $CH_3CH_2CH_2OH + SOCI_2 \longrightarrow$

(vii)
$$CH_3CH_2CH = CH_2 + HBr \xrightarrow{Peroxide}$$

(viii)
$$CH_3CH = C(CH_3)_2 + HBr \longrightarrow$$

Ans:

(ii)
$$(CH_3)_3CBr + KOH \xrightarrow{\text{Ethanol, heat}} CH_3 \xrightarrow{\text{CH}_3} -C = \acute{CH}_2 + KBr + H_2O$$
2-Brotno-2-methylpropane 2-Methylpropene

(iii)
$$CH_3 - CH - CH_2CH_3 + NaOH - \frac{Water}{(Hydrolysis)} CH_3 - CH - CH_2CH_3 + NaBr + H_2OOH$$

(iv)
$$CH_3CH_2Br + KCN \xrightarrow{\text{aq. ethanol}} CH_3CH_2CN + KBr$$

Propanenitrile

$$(vi) \ \, \text{CH}_3\text{CH}_2\text{CH}_2\text{OH} + \text{SOCl}_2 \xrightarrow{\text{Nucleophilic} \\ \text{Propan-1-ol}} \ \, \text{CH}_3\text{CH}_2\text{CH}_2\text{CI} + \text{HCI} + \text{SO}_2$$

(vii)
$$CH_3CH_2CH = CH_2 + HBr \xrightarrow{Peroxide} CH_3CH_2CH_2CH_2Br$$
But-1-ene

1-Bromobutane

(viii)
$$CH_3 - CH = C - CH_3 + HBr \xrightarrow{Markownikoff's} CH_3 - CH_2 - C - CH_3$$

Br
2-Bromo-2-methylbutane

- 5. Arrange the compounds of each set in order of reactivity towards S_N2 displacement:
- (i) 2-Bromo-2-methyibutane, 1-Bromopentane, 2-Bromopentane.
- (ii) I-Bromo-3-methylbutane, 2-Bromo-2-methylbutane, 3-Bromo-2-methylbutane.
- (iii) 1-Bromobutane, I-Bromo-2,2-dimethylpropane, I-Bromo-2-methylbutane, I-Bromo-3-methyl butane.

Ans: The S_N2 reactions reactivity depends upon steric hindrance. More the steric hindrance slower the reaction. Thus the order of reactivity will be 1°> 2° >3°

$$\begin{array}{c|c} \text{CH}_3 \\ \text{(i) CH}_3 & -\text{C} - \text{CH}_2\text{CH}_3 \\ \text{Br} \\ \text{2-Bromo-2-methyl butane} \\ \text{(3°)} \end{array} \qquad \begin{array}{c} \text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2 - \text{Br} \\ \text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2 - \text{Br} \\ \text{1-Bromopentane} \\ \text{(1°)} \\ \text{Br} \\ \text{2-Bromopentane} \\ \text{(2°)} \end{array}$$

1-Bromopentane > 2-Bromopentane > 2-Bromo-2-methylbutane

$$(ii) \ \text{CH}_{3} - \text{CH} - \text{CH}_{2} \text{CH}_{2} \text{Br} \\ \text{$^{1-\text{Bromo-3-methylbutane}}$} \\ \text{CH}_{3} - \text{CH} - \text{CH}_{2} \text{CH}_{3} \\ \text{CH}_{3} - \text{C} - \text{CH}_{2} \text{CH}_{3} \\ \text{Br} \\ \text{$^{2-\text{Bromo-2-methyl-butane}}$} \\ \text{Br} \\ \text{$^{2-\text{Bromo-2-methyl-butane}}$} \\ \text{$^{2-\text{Bromo-3-methyl-butane}}$} \\ \text{$^$$

1-Bromo-3-methylbutane > 2-Bromo-3-methylbutane > 2-Bromo -2-methyl butane

Since in case of 1° alkyl halides steric hindrance increases in the order) n-alkyl halides, alkyl halides with a substituent at any position other than the β -position, one substituent at the β -position, two substituents at the β -position, therefore, the reactivity decreases in the same order. Thus, the reactivity of the given alkyl bromides decreases in the order:

1-Bromobutane > I-Bromo-3-methylbutane > I-Bromo-2-methyjbutane > 1-Bromo-2,2-dimethyl propane.

SUMMARY

- **1.** Haloalkanes are classified as fluoro, chloro, bromo or iodo compounds according to the type of halogen present and as mono-, di- tri-, tetra- haloalkanes, etc., according to the one, two, three, four, etc., halogen atoms respectively present in their molecule.
- **2.** Alkyl halides are further classified as primary (1°), secondary (2°) and tertiary (3°) according to the halogen atom attached to primary, secondary and tertiary carbon atoms, respectively.
- **3.** Due to electronegativity difference between the carbon and the halogen, the shared pair of electron lies closer to the halogen atom. As a result, the halogen carries a small negative charge, while the carbon carries a small positive charge. Consequently, C-X bond is a polar covalent bond.
- **4. Methods of Preparation of Haloalkabes:** Haloalkanes can be prepared from displacement of alcoholic group in alkyl alcohol by halogen acid, PCl₅ or PCl₃. Haloalkanes can also be prepared by addition of halogen acids or halogens on alkene and alkyne. Alkyl halides can also be prepared by free radical halogenation of alkane.
- **5. Methods of preparation of Haloarenes.** Haloarenes can be prepared by side chain halogenation or nuclear halogenation of aromatic hydrocarbons.
- 6. From diazonium salts:
- (i) By Sandmeyer reaction:
- (ii) By Gattermann reaction:
